Problem Solving:  
In the Classroom

• Michael O’Connor:  moconnor@amsi.org.au
Problem Solving

When to do it

Problem Solving, like the other three proficiencies, has been

“incorporated into the content descriptions
... to ensure that the skills develop
throughout the curriculum and become
increasingly sophisticated over the years of schooling.”

http://www.australiancurriculum.edu.au/mathematics/content-structure
Activity 1: What is my pattern?

Example 1

3
7
11
15

Rule: Add 4 to the previous number
Activity 1: What is my pattern?

Example 2

1
3
7
15

Rule: 2 times the previous value plus 1
Problem Solving

Activity 1: What is my pattern?

Example 3

3

8

15

24

Rule: $x^2 + 2x$, where $x$ starts at 1
Explicit references to the proficiencies are indicated by the verbs used in content descriptors. The AMSI Vertical View spreadsheet provides a guide for teachers to use.

Problem Solving

When to do it

Internationally there is considerable evidence to support the approach of teaching mathematics through problem solving rather than teaching problem solving as a set of skills on their own.
Problem Solving

When to do it

There are two approaches, that can be used

• Integrating into given topic areas
• As stand alone lessons.

These are complementary rather than mutually exclusive.
Problem Solving

When to do it

Individual teachers, departments and schools need to determine how they will incorporate problem solving into the day to day structure of lessons and topics.

What follows are some examples that other teachers have used to assist with the conversation.
Problem Solving

When to do it

As part of a daily set of practice questions:
Eg: Question 20 of Elementary Maths Mastery Lessons

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>3</td>
<td>Find the least number of cuts needed to cut a log into 7 equal pieces.</td>
</tr>
<tr>
<td>4</td>
<td>Find the least number of cuts needed to cut a log into 11 equal pieces.</td>
</tr>
<tr>
<td>5</td>
<td>Can a log already cut into 2 pieces be cut into 3 equal pieces?</td>
</tr>
</tbody>
</table>

Designed to be used with students at years 5, 6 and 7
Problem Solving

Activity 2: Draw the view

Looking from the opposite direction
As an introduction to a topic, by exploration of new ideas.

For example:
This object was made using identical cubes.

Right side

Front

This is a drawing of the view from the front.

Front view

Which drawing shows the view from the right side?
Problem Solving

When to do it

By using a formal set of lessons to develop skills spaced out across one or more year levels.

Designed to be used with students at years 7 and 8.
Problem Solving

When to do it

As a project or assignment at the end of a topic.

In this age of “Google it” make sure that students cannot simply bypass the thinking process by finding the answer somewhere in cyber-space.
Problem Solving

When to do it

For example, “The Gaoler Problem”:
In a gaol with an infinite number of cells, the gaoler:
1) Locks all the cells
2) Goes to every second cell and reverses it.
3) Goes to every 3\textsuperscript{rd} cell and reverses them.
4) Goes to every 4\textsuperscript{th} cell and reverses them.
5) And so on.
In the end, which cells are unlocked?
Problem Solving

When to do it

As an extension program for gifted and talented students.

Australian Mathematics Trust: Challenge & Extension Series

Plus many more

ENRICHMENT STUDENT NOTES
The Student Notes are supplied to students enrolled in the program along with other materials provided to their teacher. The six stages offer extension material for students from year 5 to year 10, in that order.

We are making these Notes available as a text book to interested parties for whom the program is not available. The notes refer to a problems booklet, which contains assessment problems for each year. If available, we will include a complimentary copy of a previous problems booklet but solutions to these are not available.

NEWTON
Price: AU$40.00
Recommended for students of about Year 5 and 6, topics include polyominoes, arithmetricks, polyhedra, patterns and divisibility.

DIRICHLET
Price: AU$40.00
Recommended for students of Year 6 or 7, topics include problem-solving techniques, tessellations, base five arithmetic, pattern seeking, rates and number theory.

EULER
Price: AU$40.00
Recommended for students of about Year 7, topics include elementary number theory and geometry, counting and pigeonhole principle.

GAUSS
Price: AU$40.00
Recommended for students of about Year 8, topics include Pythagoras’ Theorem, Diophantine equations, counting techniques and congruences.

NOETHER
Price: AU$40.00
Recommended for students of about Year 9, topics include number theory, sequences and series, inequalities and circle geometry.

POLYA
Price: AU$40.00
Recommended for students of about Year 10, topics include polynomials, algebra, inequalities and Euclidean geometry.
Problem Solving

How to do it

Ask questions

AND

Wait for answers!

POSE
PAUSE
POUNCE
BOUNCE
Asking questions and analysing the feedback allows the teacher identify a student’s Zone of Proximal Development in real time.

Once the point is reached where the student needs a helping hand the teacher builds a scaffold to help them past the barrier.
Look at this shape.

Which picture shows the shape rotated 90° to the right about the dot?
Problem Solving

Polya’s Satchel of Strategies

Or a Toolbox of Techniques.

These can be built up over the years.

Often, a list of strategies, along with the 4 stages, are written on the classroom Maths Wall.

Some example strategies

• Guess and check
• Look for a pattern
• Draw a table
• Reduce to a simpler case
• Act it out
• Work backwards
• Draw a sketch
• Divide into subtasks
• Substitute simple values
Problem Solving

C.U.B.E.S.

- Circle any key numbers
- Underline the questions
- Box any maths action words
- Evaluate
- Solve and Check
Problem Solving

The G.I.F.T of L.I.F.E

There are two questions to ask when solving all mathematical problems

The first question is: **What do I know?**

The answer is **G.I.F.T.**

- **Given:** in the question
- **Implied:** by the context of the question, the meaning of the words or the diagrams
- **Found:** in an earlier part of the question
- **Theory:** formulas, rules and the like
The second question is like it: **What can I do?**

The answer is: **L.I.F.E.**

- **Look**, **List**, **Label** your information
- **Identify**
- **Formulate**
- **Evaluate**
Every time a student becomes stuck on a question and needs help.

If students cannot answer something then it is a problem to be solved, not just a question to be answered.

So, almost all textbook questions can be approached in a “Problem Solving” manner.
Introducing Concepts

Traditional “Textbook” Approach

1) Theory
2) Worked Examples
3) Exercise with
   - Fluency (Drill) Questions
   - Simple Worded Questions
   - Multi-part Worded Questions
4) Extended/Open Ended Challenge (maybe)
7. This is a plan of the Healey family's vegetable garden.

Use the measurements to calculate the perimeter of each garden bed.

Then calculate the length of fence required to enclose the whole garden.

The Healey family are planning their vegetable garden for next year. They want to know how much of their garden area they used for each vegetable. First, calculate the area used for each vegetable. Then add the areas together to see if they match the total area of the whole vegetable garden.
16 Sam throws a stone down to the ground from the top of a cliff $s$ metres high, with an initial speed of $u$ m/s. It accelerates at $a$ m/s$^2$. The stone hits the ground with a speed of $v$ m/s given by the formula $v^2 = u^2 + 2as$. Find the speed at which the stone hits the ground, correct to two decimal places, if:

- **a** $u = 0$, $a = 9.8$ and $s = 50$
- **b** $u = 2$, $a = 10$ and $s = 40$
- **c** $u = 5$, $a = 9.8$ and $s = 35$
- **d** $u = 10$, $a = 9.8$ and $s = 50$
Problem Solving

Activity 5: Which one is the same as?

Which of these nets make the same solid?

A

B

C

D
What are the alternatives to the “traditional” textbook approach?

Start with a problem and explore. The problem drives the learning of new knowledge and skills.

What other alternatives do you know of, or have you used?
Problem Solving

Finding Problems

<td>Adapts recipe to suit situation</td>
</tr>
<tr>
<td>Expert</td>
<td>Invents own recipes</td>
</tr>
</tbody>
</table>
### Appendix 2.1: Progression of problem-solving development – nutshell statements

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level I</td>
<td>Develop multiple strategies connecting abstract representations of objects and situations.</td>
</tr>
<tr>
<td>Level H</td>
<td>Generalise rules and/or re-evaluate possible strategies in light of information provided.</td>
</tr>
<tr>
<td>Level G</td>
<td>Draw on variety of skills to develop strategies required to solve complex problems.</td>
</tr>
<tr>
<td>Level F</td>
<td>Identify complex logical relationships in a problem. Develop non-routine problem-solving strategies.</td>
</tr>
<tr>
<td>Level E</td>
<td>Select appropriate multi-step strategy to solve problems. Translate problem into a rule.</td>
</tr>
<tr>
<td>Level D</td>
<td>Apply a range of up to two-step strategies to solve problems.</td>
</tr>
<tr>
<td>Level C</td>
<td>Apply one-step strategies to solve problems in less familiar contexts.</td>
</tr>
<tr>
<td>Level B</td>
<td>Use one-step strategies to solve problems.</td>
</tr>
<tr>
<td>Level A</td>
<td>Follow instructions to solve problems in familiar contexts.</td>
</tr>
</tbody>
</table>

Explain
Write
Problem Solving

Always, Sometimes, Never

This is an approach to exploring properties of objects or ideas.

• Pick 2 even numbers. Add them together. What do you get?
• Now pick 2 odd numbers and do the same.
• Finally pick 1 even and 1 odd number and repeat. Do you always get these results?

Try the same for multiplication.
From session 1 the Tic Tac Toe (or Leap Frog) and Triangular numbers problems can be given at several different year levels.

This emphasises:

1) Students can be introduced to the concepts at one level
2) There is plenty of depth to revisit at later times
3) Chances to reinforce/revise earlier learning
Problem Solving

When to do it

Puzzles: eg: Leap Frog - TicTacToe

What age level?

Where’s the maths?

How deep can you go?
Stephen and Sophie both work as shelf stackers for their local Safeday Supermarket. Their manager wants them to build a display for one of the aisles using soup cans. He tells them they have to stack the cans to form a triangle.

They have 300 cans to use.

How many rows of cans will there be in the display and how many cans will be in the bottom row?
Activity 6: What’s my mistake?

24 + 39 = 53

24 + 39 = 54

\[2^2 + 3^2 = 10\]

The perimeter of this rectangle is 21 cm.
1) Who does most of the talking in the lesson?
2) What questions do I (the teacher) ask?
3) Who answers the questions?
4) How well do I listen to student answers?
5) What do I do with the students’ answers?
6) How do I facilitate the learning?
7) How confident are the students to take risks and make mistakes?
8) What does my body language communicate?

Adapted from NRICH: http://nrich.maths.org/10341/index?nomenu=1
How long does a problem take?

Five Minutes? – Can it be Googled?
A lesson?
A week?
A semester?

A lifetime?

Fermat’s Last Theorem
Problem Solving

How long should a solution be?

Two lines?
Five lines?
Half a page?
Several pages?

What are the elements of a good solution?
“... students whose entire mathematical experience consisted of working exercises that could be solved in just a few minutes came to believe that “all problems can be solved in five minutes of less”, and ceased working on problems that they might have been able to solve had they persevered.”

Schoenfeld, 2013
Include:

**Problematizing** – students participate in the act of framing meaningful questions, which the class explores

**Agency and authority** – students are empowered to seek information, distil it, craft arguments, and explain them

Engle in Schoenfeld 2013
And:

**Disciplinary accountability** – students learn what it is to make claims and arguments that are consistent with disciplinary norms

**Resources** – when tools or information is needed, students have access to them

Engle in Schoenfeld 2013
Problem Solving

Collaboration

Solving problems is rarely an individual exercise, either in real life or in the mathematics classroom.

Provide opportunities for working alone, with small groups, and with large groups.

Terry Tao and the Polymath Project
## Problem Solving

### Blooms Taxonomy

**Finding the “Level” of a Problem**

1) **Knowledge/memory**
   - Fluency
2) **Comprehension/Translation**
   - Understanding
3) **Interpretation**
   - Understanding/Reasoning
4) **Application**
   - “Type 1” Problems
5) **Analysis**
   - “Type 2” Problems
6) **Synthesis**
   - “Type 3” Problems
7) **Evaluation**
   - Reflection/Metacognition

Adapted from NRICH
To help our students become successful problem solvers, we need to practice and reflect on our own problem solving capacities.
Problem Solving
Activity 7: Extending Patterns

When bees build their homes, called hives, they make cells in the shape of hexagons.

• If they start with one cell in the middle of the hive, how many cells can they fit around the first one?
• How many more will they make in the next layer?
• How many in the layer after that?
• Can you see a pattern? Describe it.
Objective Learning Materials.
Problem Solving
