## NUMBER SENSE AND ALGEBRA - INTERPRETING FRACTIONS (InF)

## InF1 - CREATING HALVES

$\square$ I can identify the part and the whole
$\square$ I can recognise that dividing a whole into 2 parts can create equal or unequal parts, e.g.

- I can show half by dividing an object into two equal parts, e.g. fold a piece of paper in half or draw a line to show half

- I can show half by dividing a collection into two equal parts, e.g. make 2 groups of 3 when halving a collection of 6 counters

## 

- I can explain the terms halfway and half

InF2 - REPEATED HALVING

- I can use repeated halving to show quarters and eighths, e.g. to find quarters you find half then halve each half

## InF3 - REPEATING FRACTIONAL PARTS

$\square$ I can recognise and compare fractional parts of a whole, e.g. I know that two quarters is twice one quarter, not just the second quarter of a whole

$\square$ I can use repetition and matching to compare the equality of parts, e.g. $\frac{1}{4}$ is smaller than $\frac{1}{3}$

| $\frac{1}{4}$ | $\frac{1}{4}$ | $\frac{1}{4}$ | $\frac{1}{4}$ |
| :---: | :---: | :---: | :---: |
| $\frac{1}{3}$ | $\frac{1}{3}$ | $\frac{1}{3}$ |  |

## InF4 - APPLYING PROPORTION

- I can calculate thirds by visualising or using approximations, e.g. imagines a paper strip in 3 parts, then adjusts and folds
$\square$ I can identify examples and non-examples of thirds and fifths, e.g.

| $\frac{1}{3}$ | $\frac{1}{3}$ | $\frac{1}{3}$ |
| :---: | :---: | :---: |

| $\frac{1}{3}$ | $\frac{1}{3}$ | $\frac{1}{3}$ |
| :---: | :---: | :---: |

$\square$ I can recognise that a whole can be used to represent different fractions, e.g. a strip of paper can be folded to show quarters then re-folded to show fifths

| $\frac{1}{4}$ | $\frac{1}{4}$ | $\frac{1}{4}$ | $\frac{1}{4}$ |
| :---: | :---: | :---: | :---: |

| $\frac{1}{5}$ | $\frac{1}{5}$ | $\frac{1}{5}$ | $\frac{1}{5}$ | $\frac{1}{5}$ |
| :---: | :---: | :---: | :---: | :---: |

$\square$ I can show that the more parts a whole is divided into the smaller the parts will become, e.g.

| $\frac{1}{2}$ | $\frac{1}{2}$ |
| :---: | :---: |

| $\frac{1}{5}$ | $\frac{1}{5}$ | $\frac{1}{5}$ | $\frac{1}{5}$ | $\frac{1}{5}$ |
| :---: | :---: | :---: | :---: | :---: |

## InF5 - EQUIVALENCE OF FRACTIONS

$\square$ I can identify the need to have equal wholes when comparing fractions
I I can represent a fraction larger than one, e.g. $\frac{4}{3}$ is one full whole and $\frac{1}{3}$ of an additional whole

| $\frac{1}{3}$ | $\frac{1}{3}$ | $\frac{1}{3}$ |
| :---: | :---: | :---: |

| $\frac{1}{3}$ |  |  |
| :--- | :--- | :--- |

- I can show equivalent fractions by dividing the same-sized whole into different parts, e.g. a fraction wall
$\square$ I can use partitioning to show the relationship between fractions, e.g. $\frac{1}{6}$ can be shown as $\frac{1}{3}$ of $\frac{1}{2}$

## InF6 - FRACTIONS AS NUMBERS

I can link fractions to division, e.g. $\frac{2}{6}$ is the same as $2 \div 6$ or 2 partitioned in 6 equal parts
$\square$ I can place fractions on a number line and explain my thinking, e.g

- I can represent fractions as decimals and percentages, e.g.

$$
\frac{1}{2}=0.5=50 \%
$$

$\square$ I can show and explain that a fraction represents a single number, not two separate whole numbers

## InF7 - USING FRACTIONS

$\square$ I can use my knowledge of equivalence to help me compare fractions, e.g. to find out if two-thirds is greater than three-quarters I can convert both fractions to twelfths
$\square$ I can explain why you need to have the same denominator to add or subtract fractions
$\square$ I can use strategies to find a fraction of a quantity, e.g. to find two thirds of 27 I can find one-third then double it
$\square$ I can demonstrate why dividing by a fraction can result in a larger a number
I I can understand the difference between multiplying and dividing fractions
